Documentation Page

December 10, 2018

Lightbox design in the gallery page is one of the most challenging designs of the website. It contains a complicated concept. I had to developed structure code that would display an image in the regular size; another one would display much closer image with a dark transparent background where the users can read more information about my works when the user clicks them. I got some idea from https://codepen.io/gschier/pen/HCoqh?editors=1100 and blended into with the CSS grid layout. With the CSS grid layout, I'm able to make it a responsive design where the width of the site would be in constant.

I used the idea of the animation gradient (https://codepen.io/P1N2O/pen/pyBNzX) where the color would slowly changing to various color. I decided to use it as my front page's background. I modified it by decreased the speed of the animation and rotated the flow. It gives away the fresh feeling for among the users.

Since my website has a responsive design and I would like to have a navigation menu that would become a drop-down menu when the width of the site become too short. I used the similar concept as this one, https://codepen.io/taniarascia/pen/dYvvYv.

I got the code structure from

https://www.w3schools.com/howto/tryit.asp?filename=tryhow_css_social_media_buttons for

social media buttons in my about page. It allows the users to go to my social media accounts

where they can check out my accounts.

For the typefaces, I decided to go with Montserrat as my primary choice for the website

and Muli for the secondary choice such as the headings. Both of them made a perfect

combination; Muli is ideal for the bold and standing out texts such as headings; meanwhile,

Montserrat is good for reading.
